## SPECIFICATION

**Novel 4-oxo-1,4-dihydronicotinic acid derivatives and salts thereof, process for producing the same, and antibacterial agents containing the same**

5 This invention relates to a novel 4-oxo-1,4-dihydronicotinic acid derivative and its salt, a process for producing the same, and an antibacterial agent containing the same. 5

10 The inventors of this invention have conducted extensive research to find a compound having a broad antibacterial spectrum, namely an excellent antibacterial activity against Gram-positive and Gram-negative bacteria, having a low toxicity, giving a high blood level when administered orally or parenterally and exhibiting a high effect on the treatment of diseases of human beings and animals. As a result, it has been found that a 4-oxo-1,4-dihydronicotinic acid derivative or its salt different in chemical structure from various commercially available antibacterial agents have the above-mentioned properties. 10

15 An object of this invention is to provide a novel antibacterial compound having a broad antibacterial spectrum and a process for producing the same. 15

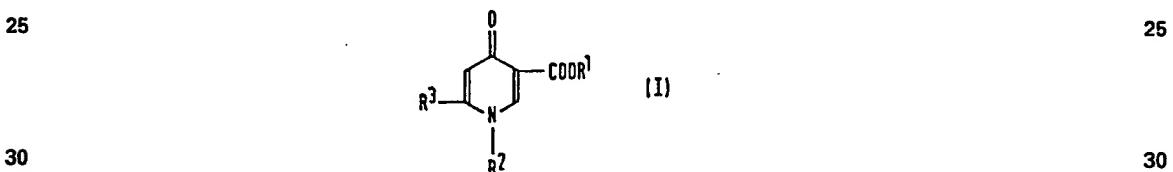

Another object of this invention is to provide an antibacterial compound having a low toxicity. 15

20 A further object of this invention is to provide an antibacterial compound which can be well absorbed orally or parenterally. 20

A still further object of this invention is to provide an antibacterial compound having an excellent effect on 25 the treatment of diseases of human beings and animals.

Other objects and advantages of this invention will become apparent from the following description.

According to this invention, there is provided a 4-oxo-1,4-dihydronicotinic acid derivative and its salt, said derivative being represented by the formula (I), 25

wherein R¹ represents a hydrogen atom or a carboxyl-protecting group; R² represents a substituted aryl group or a substituted or unsubstituted heterocyclic group; and R³ represents a haloalkyl group, an 35 aminoalkyl group or a substituted or unsubstituted alkenyl, aralkenyl, aralkyl, aralkadienyl, aralkynyl, heterocyclic alkyl, heterocyclic alkenyl, aryl, cycloalkyl, cycloalkenyl, acyl, iminoalkyl, heterocyclic or bridged hydrocarbon group, a process for producing the same, and an antibacterial agent containing the same. 35

In the formulas described herein, R¹ is a hydrogen atom or a carboxyl-protecting group. The carboxyl-protecting groups are available and include ester-forming groups which can be removed by 40 catalytic reduction, chemical reduction or other treatments under mild conditions; ester-forming groups which can easily be removed in living bodies; and other known ester-forming groups which can easily be removed by treatment with water or an alcohol, such as organic silyl-containing groups, organic phosphorus-containing groups, organic tin-containing groups, or the like. 40

Examples of typical carboxyl-protecting groups are:

45 (a) Alkyl groups, for example C<sub>1</sub>-<sub>4</sub> alkyl;

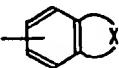

(b) Substituted lower alkyl groups, at least one of the substituents of which is halogen, nitro, acyl, alkoxy, oxo, cyano, hydroxy, di-C<sub>1</sub>-<sub>4</sub> alkylamino, cycloalkyl, aryl, alkylthio, alkylsulfinyl, alkylsulfonyl, alkoxy carbonyl, 5-alkyl-2-oxo-1,3-dioxol-4-yl, 1-indanyl, 2-indanyl, furyl, pyridyl, 4-imidazolyl, phthalimido, succinimido, azetidino, aziridino, pyrrolidino, piperidino, morpholino, thiomorpholino, pyrrolyl, pyrazolyl, thiazolyl, 50 isothiazolyl, oxazolyl, isoxazolyl, thiadiazolyl, oxadiazolyl, thi triazolyl, oxatriazolyl, triazolyl, tetrazolyl, quinolyl, phenazinyl, benzofuryl, benzothienyl, benzoxazolyl, benzothiazolyl, coumarinyl, N-lower alkylpiperazino, 2,5-dimethylpyrrolidino, 1,4,5,6-tetrahydropyrimidinyl, 4-methylpiperidino, 2,6-dimethylpiperidino, 4-(5-methyl-2-pyrrolinyl), 4-(2-pyrrolinyl), N-methylpiperidinyl, 1,3-benzodioxolanyl, alkylamino, dialkylamino, acyloxy, acylamino, acylthio, dialkylaminocarbonyl, alkoxy carbonylamino, alkenyloxy, aryloxy, aralkyloxy, alicycle-oxy, heterocycle-oxy, alkoxy carbonyloxy, alkenyloxy carbonyloxy, aryloxy carbonyloxy, aralkyloxy carbonyloxy, alicycle oxycarbonyloxy, heterocycle oxycarbonyloxy, alkenyloxy carbonyl, aryloxy carbonyl, aralkyloxy carbonyl, alicycle oxycarbonyl, heterocycle oxycarbonyl, alkylanilino or alkylanilino substituted by halogen, lower alkyl, or lower alkoxy; 55

(c) Cycloalkyl groups, lower-alkyl-substituted cycloalkyl groups, or [2,2-di(lower alkyl)-1,3-dioxolan-4-yl]methyl groups;

(d) Alkenyl groups;

(e) Alkynyl groups;

(f) Phenyl group, substituted phenyl groups, at least one of the substituents of which is selected from the substituents exemplified in above (b); or aryl groups represented by the formula:

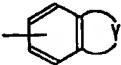

5

5

wherein  $-X-$  is  $-CH=CH-O-$ ,  $-CH=CH-S-$ ,  $-CH_2CH_2S-$ ,  $-CH=N-CH=N-$ ,  $-CH=CH-CH=CH-$ ,  $-CO-CH=CH-CO-$ , or  $-CO-CO-CH=CH-$ , or substituted derivatives thereof, the substituents of which are selected from those exemplified in above (b), or the formula:

10

10

15 wherein  $-Y-$  is a lower alkylene group such as  $-(CH_2)_3-$  and  $-(CH_2)_4-$ , or substituted derivatives thereof, the substituents of which are selected from those exemplified in above (b); 15

(g) Aralkyl groups which may be substituted, at least one of the substituents of which is selected from those exemplified in above (b);

(h) Heterocyclic groups which may be substituted, at least one of the substituents of which is selected 20 from those exemplified in above (b);

(i) Alicyclic indanyl or phthalidyl groups or substituted derivatives thereof, the substituent of which is halogen or methyl; alicyclic tetrahydronaphthyl groups, or substituted derivatives thereof, the substituent of which is halogen or methyl; trityl group, cholesteryl group, or bicyclo[4,4,0]-decyl group;

(j) Alicyclic phthalidylidene-lower alkyl group or substituted derivatives thereof, the substituent of which 25 is halogen or lower alkyl group.

The carboxyl-protecting groups listed above are typical examples, and there may be used any groups selected from those disclosed in U.S. Patents 3,499,909; 3,573,296; and 3,641,018, West German Offenlegungsschrift 2,301,014; 2,253,287; and 2,337,105.

Among them, preferable carboxyl-protecting groups are those which can readily be removed in living 30 bodies such as 5-lower alkyl-2-oxo-1,3-dioxol-4-yl-lower alkyl groups, acyloxyalkyl groups, acylthioalkyl groups, phthalidyl group, indanyl group, phenyl group, substituted or unsubstituted phthalidylidene-lower alkyl groups or groups represented by the formulas:

35 
$$\begin{array}{c} -CH(CH_2)_mOR^4, \quad -CHOCOOR^8 \quad \text{and} \quad -CH(CH_2)_mCOOR^4 \\ | \qquad | \qquad | \\ R^5 \qquad R^5 \qquad R^7 \end{array}$$
 35

40 wherein  $R^4$  represents a hydrogen atom or a straight or branched chain substituted or unsubstituted alkyl, alkenyl, aryl, aralkyl, alicyclic, or heterocyclic group;  $R^5$  represents a hydrogen atom or an alkyl group;  $R^6$  represents a straight or branched chain substituted or unsubstituted alkyl, alkenyl, aryl, aralkyl, alicyclic, or heterocyclic group;  $R^7$  represents a hydrogen atom, a halogen atom or a substituted or unsubstituted alkyl, cycloalkyl, aryl or heterocyclic group or  $-(CH_2)_n-COOR^4$  wherein  $R^4$  is as defined above and  $n$  represents 0, 45 1 or 2, and  $m$  represents 0, 1 or 2.

The above-mentioned preferable carboxyl-protecting groups include specifically 5-lower alkyl-2-oxo-1,3-dioxol-4-yl-lower alkyl groups such as 5-methyl-2-oxo-1,3-dioxol-4-ylmethyl, 5-ethyl-2-oxo-1,3-dioxol-4-ylmethyl, 5-propyl-2-oxo-1,3-dioxol-4-ylmethyl, and the like; acyloxyalkyl groups, such as acetoxyethyl, pivaloyloxymethyl, propionyloxymethyl, butyryloxymethyl, isobutyryloxymethyl, valeryloxymethyl, 50 1-acetoxy-ethyl, 1-acetoxy-n-propyl, 1-pivaloyloxy-ethyl, 1-pivaloyloxy-n-propyl and the like; acylthioalkyl groups such as acetylthiomethyl, pivaloylthiomethyl, benzoylthiomethyl, p-chlorobenzoylthiomethyl, 1-acetylthio-ethyl, 1-pivaloylthio-ethyl, 1-benzoylthioethyl, 1-(p-chlorobenzoylthio)-ethyl and the like; alkoxy-methyl groups such as methoxymethyl, ethoxymethyl, propoxymethyl, isopropoxymethyl, butyloxymethyl and the like; alkoxy-carbonyloxy-lower alkyl groups such as methoxycarbonyloxyethyl, ethoxycarbony-55 loxymethyl, propoxycarbonyloxyethyl, isopropoxycarbonyloxyethyl, n-butyloxycarbonyloxyethyl, tert-butyloxycarbonyloxyethyl, 1-methoxycarbonyloxyethyl, 1-ethoxycarbonyloxyethyl, 1-propoxycarbonyloxyethyl, 1-isopropoxycarbonyloxyethyl, 1-butyloxycarbonyloxyethyl and the like; alkoxy-carbonylalkyl groups such as methoxycarbonylmethyl, ethoxycarbonylmethyl and the like; phthalidyl group; indanyl group; phenyl group; and phthalidylidenealkyl groups such as 2-(phthalidylidene)-ethyl, 60 2-(5-fluorophthalidylidene)-ethyl, 2-(6-chlorophthalidylidene)-ethyl, 2-(6-methoxyphthalidylidene)-ethyl and the like.

In respect of  $R^2$  and  $R^3$  in the formula [I], the aryl group includes, for example, phenyl, naphthyl and the like, and the heterocyclic group includes 5-membered, 6-membered and fused ring type heterocyclic groups having at least one atom selected from N, S and O such as, thienyl, furyl, pyrrolyl, imidazolyl, pyrazolyl, 65 thiazolyl, isothiazolyl, oxazolyl, isoxazolyl, furazanyl, pyrrolidinyl, pyrrolinyl, imidazolidinyl, imidazolinyl,

65

pyrazolidinyl, pyrazolinyl, oxadiazolyl, thiadiazolyl, triazolyl, tetrazolyl, thiatriazolyl, pyridyl, pyrazinyl, pyrimidinyl, pyridazinyl, piperidinyl, piperazinyl, pyran, morpholinyl, pyridine-1-oxide-3- or 4-yl, pyridazine-1-oxide-6-yl, quinoline-1-oxide-6-yl, triazinyl, benzothienyl, naphthothienyl, benzofuryl, 2,3-dihydrobenzofuryl, benzothiazolyl, isobenzofuryl, chromenyl, indolidinyl, isoindolyl, indolyl, indazolyl, 5 purinyl, quinolyl, 1,2,3,4-tetrahydroquinolyl, 1,2-dihydroquinolyl, isoquinolyl, phthalazinyl, naphthyridinyl, quinoxaliny, 1,2,3,4-tetrahydroquinoxaliny, quinazolinyl, cinnolinyl, pteridinyl, iso chromanyl, chromanyl, indolinyl, isoindolinyl, benzoxazolyl, benzomorpholinyl, triazolopyridyl, tetrazolopyridazinyl, tetrazolopyrimidinyl, thiazolopyridazinyl, thiadiazolopyridazinyl, triazolopyridazinyl and the like. Furthermore, the haloalkyl group in R<sup>3</sup> includes halo-C<sub>1-8</sub>alkyl groups, for example, fluoromethyl, chloromethyl, bromomethyl, 10 momethyl, 1- or 2-fluoroethyl, 1- or 2-bromoethyl, 1- or 2-chloroethyl and the like. The aminoalkyl group in R<sup>3</sup> includes amino-C<sub>1-8</sub>alkyl groups, for example, aminomethyl, 1-aminoethyl, 2-aminoethyl, and the like. The alkenyl group in R<sup>3</sup> includes C<sub>2-8</sub>alkenyl groups, for example, vinyl, allyl, isopropenyl, 1-propenyl, 2-butenyl, 2-pentenyl and the like. The aralkenyl group in R<sup>3</sup> includes the above-mentioned alkenyl groups which have been substituted by the above-mentioned aryl group. The aralkyl group in R<sup>3</sup> includes C<sub>1-8</sub>alkyl 15 groups such as methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, sec.-butyl, tert.-butyl, pentyl, hexyl, octyl and the like which have been substituted by the above-mentioned aryl group. The aralkadienyl group in R<sup>3</sup> includes C<sub>4-8</sub>alkadienyl groups such as 1,3-butadienyl, 2,4-pentadienyl and the like which have been substituted by the above-mentioned aryl group. The aralkynyl group in R<sup>3</sup> includes C<sub>2-8</sub>alkynyl groups such as ethynyl, 1-propynyl, 2-propynyl and the like which have been substituted by the above-mentioned aryl 20 group. The heterocyclic alkenyl group in R<sup>3</sup> includes the above-mentioned C<sub>2-8</sub>alkenyl groups which have been substituted by the above-mentioned heterocyclic group. The heterocyclic alkyl group in R<sup>3</sup> includes the above-mentioned alkyl groups which have been substituted by the above-mentioned heterocyclic group. The cycloalkyl group in R<sup>3</sup> includes C<sub>3-8</sub>cycloalkyl groups such as cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, cyclooctyl, and the like. The cycloalkenyl group in R<sup>3</sup> includes C<sub>3-8</sub>cycloalkenyl 25 groups such as 1-cyclopropenyl, 2-cyclopropenyl, 1-cyclobutenyl, 2-cyclobutenyl, 1-cyclopentenyl, 3-cyclopentenyl, 4-cyclopentenyl, 1-cyclohexenyl, 3-cyclohexenyl, 4-cyclohexenyl, cycloheptenyl, cyclooctenyl and the like. The iminoalkyl group in R<sup>3</sup> includes imino-C<sub>1-8</sub>alkyl groups, for example, iminomethyl, 1-iminoethyl, 2-iminoethyl and the like. The acyl group in R<sup>3</sup> includes formyl group; alkanoyl groups such as acetyl, propionyl and the like; aroyl groups such as benzoyl, p-nitrobenzoyl and the like; and heterocyclic 30 carbonyl group such as thenoyl, furoyl and the like. The bridged hydrocarbon group in R<sup>3</sup> includes C<sub>4-15</sub> bridged hydrocarbons, such as 3,6-methanocyclohexen-4-yl, adamantyl and the like.

As the substituents for said R<sup>2</sup> and R<sup>3</sup> groups, there may be used halogen atoms, for example, fluorine, chlorine, bromine, iodine and the like; alkyl groups such as straight or branched chain C<sub>1-10</sub>alkyl groups, for example, methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, sec.-butyl, tert.-butyl, pentyl, hexyl, heptyl, 35 octyl and the like; aralkyl groups such as phenyl-C<sub>1-4</sub>alkyl groups and naphthyl-C<sub>1-4</sub>alkyl groups, for example, benzyl, phenethyl, naphthylmethyl, naphthylethyl and the like; hydroxyl group; alkoxy groups such as C<sub>1-10</sub>alkoxy groups, for example, methoxy, ethoxy, n-propoxy, isopropoxy, n-butoxy, isobutoxy, sec.-butoxy, tert.-butoxy, pentyloxy, hexyloxy, heptyloxy, octyloxy and the like; alkylthio groups such as C<sub>1-10</sub>alkylthio groups, for example, methylthio, ethylthio, n-propylthio, isopropylthio, n-butylthio, isobutylthio, sec.-butylthio, tert.-butylthio, pentythio, heptythio, heptylthio, octylthio and the like; nitro group; 40 cyano group; amino group; alkylamino groups such as C<sub>1-8</sub>alkylamino groups, for example, methylamino, ethylamino, n-propylamino, isopropylamino, n-butylamino, isobutylamino, sec.-butylamino, tert.-butylamino, and the like; di-alkylamino groups such as di-C<sub>1-8</sub>alkylamino groups, for example, dimethylamino, diethylamino, di-n-propylamino, di-n-butylamino and the like; alkenylamino groups such as C<sub>2-8</sub>alkenylamino groups, for example, vinylamino, alkylamino and the like; carboxyl group; carbamoyl group; acyl groups such as formyl group, alkanoyl group, for example, acetyl, propionyl and the like, aroyl groups, for example, benzoyl, p-nitrobenzoyl and the like, and heterocyclic carbonyl groups, for example, thenoyl, furoyl and the like; acyloxy groups, for example acyl-O- groups in which the acyl is the same as mentioned above; acylalkyl groups, for example, the above-mentioned alkyl groups which have been substituted by the 45 above-mentioned acyl group; acylamino groups, for example, acyl-NH- groups in which the acyl is the same as mentioned above; alkoxy carbonyl groups, for example, 50

groups in which the alkoxy is the same as mentioned above; aminoalkyl groups, for example, NH<sub>2</sub>-alkyl 60 groups in which the alkyl is the same as mentioned above; alkylaminoalkyl groups, for example, the above-mentioned alkyl groups which have been substituted by the above-mentioned alkylamino group; dialkylaminoalkyl groups, for example, the above-mentioned alkyl groups which have been substituted by the above-mentioned dialkylamino group; hydroxyalkyl groups, for example, HO-alkyl groups in which the alkyl is the same as mentioned above; hydroxyminoalkyl groups, for example, HON=alkyl in which the alkyl 65 is the same as mentioned above; alkoxyalkyl groups, for example, the above-mentioned alkyl groups

substituted by the above-mentioned alkoxy group; carboxyalkyl groups, for example, HOOC-alkyl groups in which the alkyl is the same as mentioned above; alkoxy carbonylalkyl groups, for example,

5 alkoxy-C-alkyl

5

10 groups in which the alkoxy and the alkyl are the same as mentioned above; sulfoalkyl groups, for example, the above-mentioned alkyl groups substituted by a sulfo group; sulfo group; sulfoxyl group; sulfamoyl group; sulfamoylalkyl groups, for example, the above-mentioned alkyl groups which have been substituted by a sulfamoyl group; carbamoylalkyl groups, for example, the above-mentioned alkyl groups which have been substituted by a carbamoyl group; aryl groups, for example, phenyl, naphthyl and the like; arylthio groups, for example, aryl-S- groups in which the aryl is the same as mentioned above; aryloxy groups, for example, aryl-O- groups in which the aryl is the above-mentioned; oxo group; thioxo group; mercapto group; ureido group; hydroxyamino group; hydroxylalkylamino groups, for example, HO-alkyl-NH- groups in which the alkyl is the same as mentioned above; halogenoalkyl groups, such as mono-, di- or tri-halogeno-C<sub>1</sub>-<sub>4</sub>alkyl groups; for example, chloromethyl, bromomethyl, dichloromethyl, dibromomethyl, 15 trifluoromethyl, dichloroethyl and the like; C<sub>2</sub>-<sub>8</sub>alkenyl groups, for example, vinyl, allyl, isopropenyl, 1-propenyl, 2-but enyl, 2-pentenyl and the like; C<sub>2</sub>-<sub>8</sub>alkynyl groups, for example, ethynyl, 1-propynyl, 2-propynyl and the like; alkenylamino groups, for example, alkenyl-NH- groups in which the alkenyl is the same as mentioned above; C<sub>3</sub>-<sub>8</sub>cycloalkyl groups, for example, cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl and the like; C<sub>6</sub>-<sub>8</sub>cycloalkadienyl groups, for example, cyclohexadienyl, cyclohepta-20 dienyl and the like; C<sub>1</sub>-<sub>4</sub>alkylenedioxy groups, for example, methylenedioxy, ethylenedioxy, trimethylene-dioxy and the like; epoxy group; heterocyclic groups, such as 5-membered, 6-membered and fused ring type 25 heterocyclic groups containing at least one atom selected from N, S and O, for example, thiienyl, furyl, pyrrolyl, imidazolyl, pyrazolyl, thiazolyl, isothiazolyl, oxazolyl, isoazolyl, furazanyl, pyrrolidinyl, pyrrolinyl, imidazolidinyl, imidazolinyl, pyrazolidinyl, pyrazolinyl, oxadiazolyl, thiadiazolyl, triazolyl, tetrazolyl, thia-30 triazolyl, pyridyl, pyrazinyl, pyrimidinyl, pyridazinyl, piperidinyl, piperazinyl, pyranyl, morpholinyl, pyridine-1-oxide-2-yl, pyridazine-1-oxide-6-yl, quinoline-1-oxide-6-yl, triazinyl, benzothienyl, naphthothienyl, benzofuryl, 2,3-dihydrobenzofuryl, benzothiazolyl, isobenzofuryl, chromenyl, indolidinyl, isoindolyl, indolyl, indazolyl, purinyl, quinolyl, isoquinolyl, 1,2,3,4-tetrahydroquinolyl, 1,2-dihydroquinolyl, phthalazinyl, naphthylidinyl, quinoxalinyl, 1,2,3,4-tetrahydroquinoxalinyl, quinazolinyl, cinnolinyl, pteridinyl, isochromanyl, 35 chromanyl, indolinyl, isoindolinyl, benzoazolyl, benzomorpholinyl, triazolopyridyl, tetrazolopyridazinyl, tetrazolopyrimidinyl, thiazolopyridazinyl, thiadiazolopyridazinyl, triazolopyridazinyl and the like; and 5-nitrofurfurylideneamino groups and the like. R<sup>2</sup> and R<sup>3</sup> may have at least one of the above-mentioned 40 substituents. In particular, halogen atoms, alkyl groups, hydroxyl group, amino group, alkoxy groups, alkylamino groups, dialkylamino groups, nitro group, aryl groups and heterocyclic groups are preferred as the substituents.

The above-mentioned substituents for R<sup>2</sup> and R<sup>3</sup> may have at least one substituent selected from halogen atoms, hydroxyl group, carboxyl group, nitro group, alkyl groups, alkoxy groups, amino group, alkylamino groups, dialkylamino groups, aryl groups, acyl groups and the like, in which as the halogen atoms, alkyl groups, alkoxy groups, alkylamino groups, dialkylamino groups, aryl groups and acyl groups, there may be used those mentioned above as substituents for R<sup>2</sup> and R<sup>3</sup>.

45 Furthermore, when R<sup>2</sup> and R<sup>3</sup> of the present compound have hydroxyl, amino or carboxyl, these groups may be protected by known protecting groups. As the protecting group for the hydroxyl group, there may be used all groups which can conventionally be used for the protection of hydroxyl group, specifically including readily removable acyl groups such as benzyloxycarbonyl, 4-nitrobenzyloxycarbonyl, 50 4-bromobenzylloxycarbonyl, 4-methoxybenzylloxycarbonyl, 3,4-dimethoxybenzylloxycarbonyl, 4-(phenylazo)benzylloxycarbonyl, 4-(4-methoxyphenylazo)benzylloxycarbonyl, tert.-butoxycarbonyl, 1,1-dimethylpropoxycarbonyl, isopropoxycarbonyl, diphenylmethoxycarbonyl, 2,2,3-trichloroethoxycarbonyl, 2,2,2-tribromoethoxycarbonyl, 2-furfuryloxycarbonyl, 1-adamantyloxycarbonyl, 1-cyclopropylethoxycarbonyl, 8-quinolylloxycarbonyl, formyl, acetyl, chloroacetyl, trifluoroacetyl and the like, 55 as well as benzyl, benzhydryl, trityl, methoxymethyl, tetrahydrofuryl, tetrahydropyranyl, 2-nitrophenylthio, 2,4-dinitrophenylthio and the like. As the protecting group for the amino group, there may be used all groups which can conventionally be used for the protection of amino group, specifically including readily removable acyl groups such as 2,2,2-trichloroethoxycarbonyl, 2,2,2-tribromoethoxycarbonyl, benzylloxycarbonyl, p-toluenesulfonyl, p-nitrobenzylloxycarbonyl, o-bromobenzylloxycarbonyl, o-nitrophenylsulfonyl, acetyl, 60 (mono-, di- or tri-)chloroacetyl, trifluoroacetyl, formyl, tert.-amyoxy carbonyl, tert.-butoxycarbonyl, p-methoxybenzylloxycarbonyl, 3,4-dimethoxybenzyloxycarbonyl, 4-(phenylazo)benzylloxycarbonyl, 4-(4-methoxyphenylazo)benzylloxycarbonyl, pyridine-1-oxide-2-yl-methoxycarbonyl, 2-furyloxycarbonyl, diphenylmethoxycarbonyl, 1,1-dimethylpropoxycarbonyl, isopropoxycarbonyl, 1-cyclopropylethoxycarbonyl, phthaloyl, succinyl, 1-adamantyloxycarbonyl, 8-quinolylloxycarbonyl and the 65 like, as well as such readily removable groups as trityl, 2-nitrophenylthio, 2,4-dinitrophenylthio, 2-

hydroxybenzylidene, 2-hydroxy-5-chlorobenzylidene, 2-hydroxy-1-naphthylmethylen, 3-hydroxy-4-pyridylmethylen, 1-methoxycarbonyl-2-propylidene, 1-ethoxycarbonyl-2-propylidene, 3-ethoxycarbonyl-2-butylidene, 1-acetyl-2-propylidene, 1-benzoyl-2-propylidene, 1-[N-(2-methoxyphenyl)carbamoyl]-2-propylidene, 1-[N-(4-methoxyphenyl)carbamoyl]-2-propylidene, 2-ethoxycarbonylcyclohexylidene, 2-ethoxycarbonylcyclopentylidene, 2-acetylcyclohexylidene, 3,3-dimethyl-5-oxocyclohexylidene, 4-nitrofurylidene and the like, and other protecting groups for amino group such as di- or tri-alkylsilyl and the like. As the protecting groups for carboxyl group, there may be used all groups which can conventionally be used for the protection of carboxyl group, specifically including such groups as methyl, ethyl, n-propyl, iso-propyl, tert.-butyl, n-butyl, benzyl, diphenylmethyl, trityl, p-nitrobenzyl, p-methoxybenzyl, benzoyl-methyl, acetyl-methyl, p-nitrobenzoyl-methyl, p-bromobenzoyl-methyl, p-methanesulfonylbenzoyl-methyl, phthalimidomethyl, 2,2,2-trichloroethyl, 1,1-dimethyl-2-propenyl, 1,1-dimethylpropyl, acetoxymethyl, propionyloxymethyl, pivaloyloxymethyl, 3-methyl-3-butynyl, succinimidomethyl, 1-cyclopropylethyl, methylsulfonylmethyl, phenylthiomethyl, dimethylaminomethyl, quinoline-1-oxide-2-yl-methyl, pyridine-1-oxide-2-ylmethyl, bis(p-methoxyphenyl)methyl and the like; non-metallic compounds such as titanium tetrachloride; 15 and silyl compounds such as dimethylchlorosilane as mentioned in Japanese Patent Application Kokai (Laid-Open) No. 7,073/71, and Dutch Patent Application No. 71 05259 (Laid-open). 15

The salts of the compound represented by the formula [I] include conventionally known salts at basic groups, such as amino group and salts at acidic groups, such as carboxyl group. The salts at basic groups include, for example, salts with mineral acids, such as hydrochloric acid, sulfuric acid and the like, salts with 20 organic carboxylic acids such as oxalic acid, formic acid, trichloroacetic acid and trifluoroacetic acid and the like; salts with sulfonic acids such as methanesulfonic acid, p-toluenesulfonic acid, naphthalenesulfonic acid and the like; and salts with amino acids such as aspartic acid, glutamic acid and the like. The salts at acidic groups include, for example, salts with alkali metals such as sodium, potassium and the like; salts with alkaline earth metals such as calcium, magnesium and the like; ammonium salt, salts with nitrogen-25 containing organic bases such as procain, dibenzylamine, N-benzyl-β-phenethylamine, 1-phenamine, N,N-dibenzylethylenediamine and the like; and salts with other nitrogen-containing organic bases such as triethylamine, trimethylamine, tributylamine, pyridine, N,N-dimethylaniline, N-methylpiperidine, N-methylmorpholine, diethylamine, dicyclohexylamine and the like.

Moreover, when the compounds represented by the formula [I] and their salts have isomers, for example, 30 optical isomers, geometrical isomers, tautomeric isomers and the like, these isomers are all included in the present invention, and all crystal forms and hydrates are also included in the present invention.

The antibacterial activity and acute toxicity of the representative compounds of this invention are as follows:

35 1. Antibacterial activity 35  
Test method

According to the standard method of the Nippon Chemotherapy Society [Chemotherapy, Vol. 23, pages 1 to 2 (1975)], a bacterial solution obtained by culturing in Heart Infusion broth (manufactured by Eiken 40 Kagaku) at 37°C for 20 hours was inoculated into a Heart Infusion agar medium (manufactured by Eiken Kagaku) containing a test drug, and subjected to culturing at 37°C for 20 hours, after which the growth of bacteria was observed to determine the minimum concentration at which the growth of bacteria was inhibited, which is expressed as MIC (μg/ml). The amount of bacteria inoculated was 10<sup>4</sup> cells per plate (10<sup>6</sup> cells per ml).

45 \* Penicillinase-producing bacteria  
\*\* Cephalosporinase-producing bacteria

50 MIC values of various compounds of this invention represented by the formula [I] in which R<sup>1</sup> is hydrogen are shown in Table 1. 50

## 2. Acute toxicity test

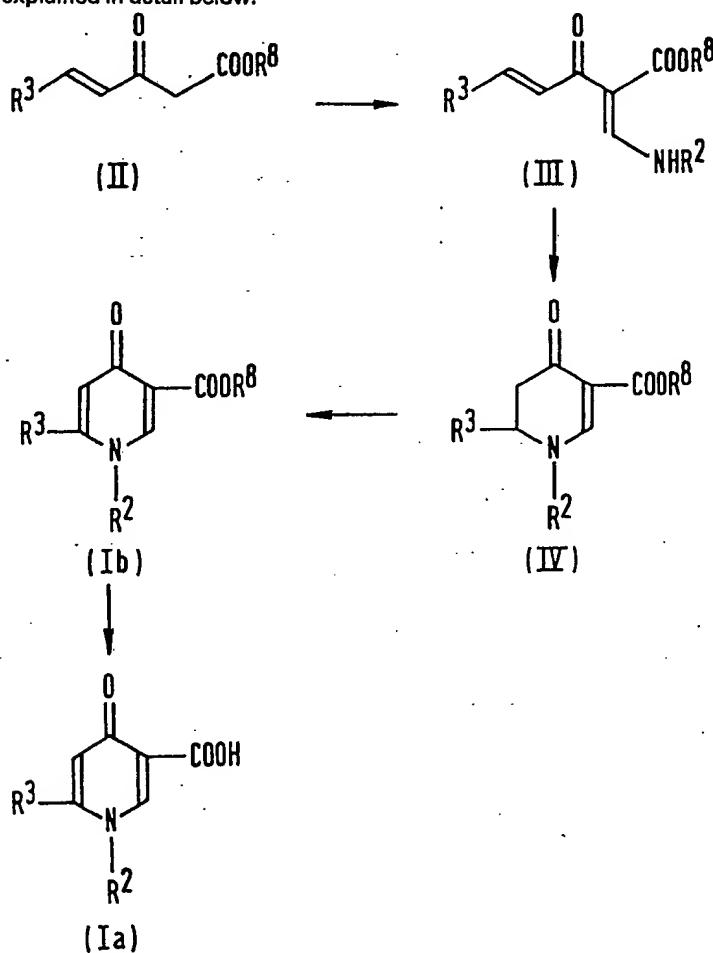

The LD<sub>50</sub> values of the representative compounds of this invention when administered intravenously to mice (ICR strain, male, 18-24 g) are shown in Table 2.

TABLE 2

5	10	15	20	25	5	10	15	20	25
LD <sub>50</sub> (mg/kg)									

Next, the process for producing the compound of this invention is explained below.

The compound of this invention can be produced in the manner known per se, and a representative production process is explained in detail below.

In the above formulas,  $R^2$  and  $R^3$  have the same meanings as defined above, and  $R^8$  represents a carboxyl-protecting group as explained for  $R^1$ .

The compound represented by the formula [II] can be produced by a conventional method, for example, the Wittig reaction using a corresponding  $R^3\text{CHO}$  as the starting material. This compound is reacted with 5 N,N-dimethylformamidodimethylacetal or N,N-dimethylformamidodioethylacetal, and thereafter, the reaction product is reacted with  $R^2\text{NH}_2$  to obtain a compound represented by the formula [III]. The solvent which are used in this reaction may be any solvent inert to the reaction, for example, an aromatic hydrocarbon such as benzene, toluene, xylene or the like; an ether such as dioxane, tetrahydrofuran, anisole, diethyleneglycol dimethyl ether, dimethyl Cellosolve (RTM) or the like; a halogenated hydrocarbon, such as 10 methylene chloride, chloroform, dichloroethane or the like; an amide such as N,N-dimethylformamide, N,N-dimethylacetamide or the like; or a sulfoxide such as dimethylsulfoxide or the like. The amount of the acetal used is preferably 1 mole or more, more preferably 1.0 to 1.2 moles, per mole of the compound represented by the formula [II], and this reaction is usually completed at a temperature of 0°C to 80°C in a period of 10 minutes to 10 hours. In order to subsequently react the product with  $R^2\text{NH}_2$ , the same solvent as 15 mentioned above is used, and the amine is used in an amount of one mole per mole of the compound represented by the formula [II]. The reaction is conducted at a temperature of 0°C to 100°C for a period of 30 minutes to 10 hours.

As an alternative method, there is a method which comprises reacting the compound represented by the formula [II] with ethyl orthoformate or methyl orthoformate in acetic anhydride, and thereafter, reacting the 20 product with  $R^2\text{NH}_2$  to obtain the compound represented by the formula [III]. In this case, the orthoformic acid ester is used in an amount of one more or more, preferably 1.0 to 1.2 moles, per mole of the compound represented by the formula [II] and the reaction is conducted at a temperature of 20°C to 100°C for a period of 5 minutes to 10 hours. Subsequently, the reaction product is reacted with  $R^2\text{NH}_2$  in a proportion of one more or more, preferably 1.0 to 1.2 moles, per mole of the compound represented by the formula [II], in the 25 presence of the above-mentioned solvent or in the absence of any solvent, to obtain the compound represented by the formula [III].

The compound represented by the formula [IV] is produced by subjecting the compound represented by the formula [III] to ring-closure reaction. This reaction is conducted in the presence or absence of a solvent such as an amide, for example, N,N-dimethylformamide, N,N-dimethylacetamide or the like, a sulfoxide, for 30 example, dimethylsulfoxide or the like; or a phosphoric acid ester, for example, ethyl polyphosphate or the like, and is preferably completed at a temperature of 50°C to 150°C for a period of 1 hour to 10 hours.

Further, the compound represented by the formula [Ib] is produced by reacting the compound represented by the formula [IV] with a dehydrogenating agent. As this dehydrogenating agent, there may be used all dehydrogenating agents which can conventionally be used, preferably 2,3-dichloro-5,6-dicyano-p-35 benzoquinone, 2,3,5,6-tetrachloro-p-benzoquinone, 3,4,5,6-tetrachloro-o-benzoquinone or the like, and this dehydrogenating agent may be used in a proportion of one more or more, preferably 1.0 to 1.2 moles, per mole of the compound represented by the formula [IV]. This reaction is usually conducted in a solvent, and preferable examples of the solvent are aromatic hydrocarbons, such as benzene, toluene, xylene and the like; and ethers such as dioxane, tetrahydrofuran, anisole, diethyleneglycol dimethyl ether, dimethyl 40 Cellosolve and the like. Said reaction is completed at a temperature of 0°C to 100°C in a period of 1 minute to 10 hours.

The compound thus obtained is hydrolyzed by a conventional method, for example, hydrolyzed at a temperature of 0°C to 100°C for a period of 5 minutes to 10 hours in the presence of an alkali or an acid, thereby obtaining the compound represented by the formula [Ia].

45 In producing the compounds represented by the formula [Ia] or [Ib] via the above-mentioned reaction route, the compound represented by the formula [III] and/or the compound represented by the formula [IV] can be subjected to the subsequent reaction without being isolated.

When the compounds represented by the formula [II], [III], [IV] and [Ib] have active groups, for example, hydroxyl group, amino group, carboxyl group or the like in other sites than the reactive sites, the active 50 groups are previously protected by a protecting group in a conventional manner, and the protecting group is removed after the completion of the reaction in a conventional manner to produce the above compounds.

The compounds thus produced may be, if desired, subjected to a reaction known per se, such as halogenation, esterification, amidation, ureidation, alkylation, alkenylation, alkylidenation, acylation, hydroxylation, iminomethylation, reduction or the like, to derive other compounds therefrom, and hence, 55 have uses as intermediates.

When the compound of this invention is used as a medicine the compound is formed into tablet, capsule, powder, syrup, granule, suppository, ointment, injection or the like in a conventional manner using a proper carrier which is usually used in the formation of a preparation. The administration method, dose and administration time may be varied depending upon symptoms of patients, and usually, the compound may 60 be administered to an adult orally or parenterally (administration by injection or administration to rectal region) in a dose of 0.1 to 100 mg/Kg/day in terms of the compound represented by the formula [I] at one time or in several portions.

This invention is further explained in more detail below referring to Referential Examples, Examples and Preparation Examples.

*Referential Example 1*

5 In 20 ml of methanol were dissolved 1.6 g of benzo[b]thiophene-2-aldehyde and 5.1 g of [2-methoxy-3-(methoxycarbonyl)allyl]triphenylphosphonium bromide, and to this solution was added dropwise 2.1 g of a 28% by weight solution of sodium methoxide in methanol with stirring at room temperature over 10 minutes. This mixture was further reacted at the same temperature for 20 minutes, and the solvent was then removed by distillation under reduced pressure. To the residue was added 20 ml of water, and the resulting 10 mixture was extracted with 20 ml of chloroform. The extract was dried with anhydrous magnesium sulfate and the solvent was removed by distillation under reduced pressure. The residue was purified by a column chromatography (Wako Silica Gel C-200; eluent: benzene/n-hexane (3:1 by volume) mixture) to obtain an oily substance. This oily substance was dissolved in 12 ml of dioxane, and to the resulting solution was 15 added 12 ml of 0.1 N sulfuric acid. The resulting mixture was subjected to reaction at 100°C for 1.5 hours. This reaction mixture was then cooled to room temperature and 20 ml of water was added thereto, after which the precipitated crystals were collected by filtration. These crystals were washed with water and then dried to obtain 1.1 g of methyl 5-(2-benzo[b]thienyl)-3-oxo-4-pentenoate having a melting point of 105-107°C.

**Referential Example 2**

In 100 ml of methanol was dissolved 25.7 g of [2-methoxy-3-(methoxycarbonyl)allyl]triphenylphosphonium bromide, and to this solution was added dropwise 10.5 g of a 28% by weight solution of sodium methoxide in methanol with stirring at room temperature over 10 minutes. To the mixed solution 5 was then further added 5 g of 1,2,3,6-tetrahydrobenzaldehyde at room temperature and the resulting mixture was subjected to reaction at the same temperature for 2 hours. After completion of the reaction, the solvent was removed by distillation under reduced pressure, and to the residue was added 50 ml of water. The resulting mixture was extracted with 50 ml of chloroform. The extract was dried with anhydrous magnesium sulfate, and the solvent was then removed by distillation under reduced pressure. The residue was purified 10 by a column chromatography (Wako Silica Gel C-200; eluent: benzene/n-hexane (3:1 by volume) mixture) to obtain an oily substance. This oily substance was dissolved in 100 ml of dioxane, and to the solution was then added 100 ml of 0.1 N sulfuric acid. The resulting mixture was subjected to reaction at 100°C for 1.5 hours. The solvent was then removed by distillation under reduced pressure, and to the residue was added 100 ml of chloroform. The resulting mixture was washed with 100 ml of water. The organic layer was 15 separated, and dried with anhydrous magnesium sulfate and then the solvent was removed by distillation under reduced pressure. The residue was purified by a column chromatography (Wako Silica Gel C-200; eluent: benzene/n-hexane (3:1 by volume) mixture) to obtain 7.5 g of oily methyl 5-(cyclohexen-4-yl)-3-oxo-4-pentenoate. 15

**Example 1**

(1) In 10 ml of benzene was dissolved 2.0 g of methyl 5-(4-chlorophenyl)-3-oxo-4-pentenoate, and to this 25 solution was added 1.2 g of N,N-dimethylformamidodimethylacetal. The resulting mixture was subjected to reaction at 70°C for 1.5 hours. The reaction mixture was cooled to room temperature, and 1.12 g of p-fluoroaniline was then added thereto, after which the resulting mixture was further subjected to reaction for 1.5 hours. After completion of the reaction, 10 ml of diethyl ether was added to the reaction mixture, and the precipitated crystals were collected by filtration, and washed with 10 ml of diethyl ether to obtain 2.2 g of 30 methyl 5-(4-chlorophenyl)-2-(4-fluorophenylaminomethylene)-3-oxo-4-pentenoate having a melting point of 166 - 168°C. 30

## 50 Example 2

(1) In 25 ml of methylene chloride were dissolved 3.1 g of 2-naphthaldehyde and 9.4 g of [2-methoxy-3-(methoxycarbonyl)allyl]triphenylphosphonium bromide, followed by addition thereto of 19 ml of a 50% by weight aqueous sodium hydroxide solution with stirring at room temperature, and the mixture was subjected to reaction at the same temperature for 20 minutes. After completion of the reaction, the methylene chloride layer was separated from the reaction mixture and washed with water. It was then dried with anhydrous sodium sulfate, and the solvent was removed by distillation under reduced pressure. To the residue was added 30 ml of diethyl ether, and the insolubles were removed by filtration, after which the filtrate was concentrated to obtain an oily substance. This oily substance was dissolved in a mixed solvent of 45 ml of dioxane and 40 ml of 0.1 N sulfuric acid, and the solution was refluxed for 30 minutes. Then the reaction mixture was cooled to room temperature, extracted with 100 ml of ethyl acetate and the extract was dried with anhydrous sodium sulfate. The solvent was removed by distillation under reduced pressure, and the formed crystals were suspended in 50 ml of benzene, and to the suspension was added 2.4 g of N,N-dimethylformamidodimethylacetal, and the resulting mixture was subjected to reaction at 60°C for 30 minutes. The reaction mixture was cooled to room temperature, and 2.2 g of p-aminophenol was added thereto. The mixture was subjected to reaction at the same temperature for 2 hours.

(2) In 12 ml of N,N-dimethylformamide was dissolved 1.7 g of methyl 2-(4-hydroxyphenylamino-methylene)-5-(2-naphthyl)-3-oxo-4-pentenoate, and they were reacted at 140°C for 2 hours. After completion 25 of the reaction, the solvent was removed by distillation under reduced pressure, and the residue was purified by a column chromatography (Wako Silica Gel C-200; eluent: chloroform/methanol (19:1 by volume) mixture). The purified oily substance was dissolved in 15 ml of dioxane and the resulting solution was heated to 80°C. To this solution was added dropwise at 80°C a solution formed by dissolving 1.1 g of 2,3,5,6-tetrachloro-p-benzoquinone in 15 ml of dioxane. After this addition was completed, the solvent was 30 removed by distillation under reduced pressure, and to the residue was added 20 ml of a chloroform/methanol (5:1 by volume) mixed solvent. The crystals thus formed were collected by filtration, washed with 5 ml of the same mixed solvent as mentioned above, and then dried to obtain 0.75 g of methyl 1-(4-hydroxyphenyl)-6-(2-naphthyl)-4-oxo-1,4-dihydronicotinate having a melting point of 280°C or more.

65 2,3,5,6-tetrachloro-p-benzoquinone in 18 ml of benzene at 80°C. After completion of this dropwise addition, 65

the reaction mixture was cooled to room temperature, and the precipitated crystals were collected by filtration and washed with 30 ml of benzene. These crystals were then dissolved in a mixed solution of 20 ml of methanol and 20 ml of a 1 N aqueous sodium hydroxide solution, and they were reacted at room temperature for 30 minutes. The reaction solution was adjusted to a pH of 6.0 with acetic acid and the precipitated crystals were collected by filtration, washed with water and dried to obtain 2.3 g of 6-(4-acetaminophenyl)-1-(4-fluorophenyl)-4-oxo-1,4-dihydronicotinic acid having a melting point of 249-250°C.

**Example 4**

In 10 ml of N,N-dimethylformamide was dissolved 2.0 g of methyl 5-(3-methyl-4-dimethylaminophenyl)-3-oxo-4-pentenoate, and 1.1 g of N,N-dimethylformamidodimethylacetal was added to the resulting solution, after which they were reacted at 70°C for 1.5 hours. To the reaction mixture was then added 1.0 g of 5 p-fluoroaniline at 70°C, and they were reacted at 80°C for 2 hours and further at 140°C for 3 hours. After 5 completion of the reaction, the reaction mixture was cooled to room temperature and the solvent was removed by distillation under reduced pressure. The residue was purified by a column chromatography (Wako Silico Gel C-200; eluent: chloroform) to obtain an oily substance. This oily substance was dissolved in 10 ml of dioxane, and to this solution was added dropwise a solution of 2.1 g of 2,3-dichloro-5,6-dicyano-p-10 benzoquinone in 10 ml of benzene at 80°C. Thereafter, the mixture was subjected to reaction at the same temperature for 30 minutes and the solvent was removed by distillation under reduced pressure. The residue was suspended in 50 ml of chloroform and 50 ml of water, and after adjusting this suspension to a pH 7.5 with sodium hydrogencarbonate, the organic layer was separated, washed successively with 10 ml of water and 20 ml of a saturated aqueous solution of sodium chloride and then dried with anhydrous magnesium 15 sulfate. The solvent was removed by distillation under reduced pressure to obtain 1.8 g of methyl 1-(4-fluorophenyl)-6-(3-methyl-4-dimethylaminophenyl)-4-oxo-1,4-dihydronicotinate having a melting point of 217-220°C.

**Example 7**

In a mixed solvent of 2.5 ml of anisole and 2.5 ml of trifluoroacetic acid was dissolved 0.25 g of methyl 6-(4-diphenylmethoxy carbonylphenyl)-1-(4-fluorophenyl)-4-oxo-1,4-dihydronicotinate, and they were reacted at room temperature for 1.5 hours. After completion of the reaction, the solvent was removed by 5 distillation under reduced pressure, and the residue was dissolved in a mixed solvent of 2.5 ml of ethanol and 2.5 ml of a 1 N aqueous sodium hydroxide solution, and the resulting solution was subjected to reaction at room temperature for 3 hours. After completion of the reaction, 20 ml of water and 20 ml of benzene were added to the reaction mixture and the aqueous layer was separated. The aqueous solution thus obtained 10 was adjusted to a pH of 5.5 with acetic acid and the precipitated crystals were collected by filtration, to obtain 0.10 g of 6-(4-carboxyphenyl)-1-(4-fluorophenyl)-4-oxo-1,4-dihydronicotinic acid having a melting point of 280°C or more.

**Example 13**

In 5 ml of N,N-dimethylformamide was dissolved 0.35 g of methyl 6-(4-aminophenyl)-1-(4-fluorophenyl)-4-oxo-1,4-dihydronicotinate, and 1 g of 2-bromoethanol and 0.3 g of triethylamine were added to the solution, after which the resulting mixture was refluxed for 2 hours. After completion of the reaction, the reaction mixture was cooled to room temperature, and 10 ml of water was then added thereto, after which the resulting mixture was extracted with 10 ml of chloroform. The extract was washed with 10 ml of a saturated aqueous solution of sodium chloride and dried with anhydrous magnesium sulfate. Then, the solvent was removed by distillation under reduced pressure and the residue was purified by a column chromatography (Wako Silica Gel C-200; eluent: chloroform) to obtain an oily substance. This oily substance was dissolved in a mixture of 2 ml of methanol and 3 ml of a 1 N aqueous sodium hydroxide solution, and they were reacted at room temperature for 30 minutes. After completion of the reaction, the reaction mixture was adjusted to a pH of 6.0 with acetic acid, and the precipitated crystals were collected by filtration, washed with water and dried to obtain 0.15 g of 1-(4-fluorophenyl)-6-[4-N-(2-hydroxyethyl)aminophenyl]-4-oxo-1,4-dihydronicotinic acid having a melting point of 226 - 228°C.

**Example 14**

In 5 ml of N,N-dimethylformamide was dissolved 0.5 g of methyl 6-(4-aminophenyl)-1-(4-fluorophenyl)-4-oxo-1,4-dihydronicotinate, and 0.23 g of allyl chloride and 0.3 g of triethylamine were added thereto, and the resulting mixture was refluxed for 3 hours. After completion of the reaction, the reaction mixture was cooled, 5 and 10 ml of water was added thereto, after which the resulting mixture was extracted with 10 ml of chloroform. The extract was washed with 10 ml of a saturated aqueous solution of sodium chloride and dried with anhydrous magnesium sulfate. The solvent was then removed by distillation under reduced pressure, and the residue was purified by a column chromatography (Wako Silico Gel C-200; eluant: chloroform) to obtain an oily substance. This oily substance was dissolved in a mixture of 2 ml of methanol and 3 ml of a 1 N 10 aqueous sodium hydroxide solution, and they were reacted at room temperature for 30 minutes. After completion of the reaction, the reaction mixture was adjusted to a pH of 6.0 with acetic acid, and the precipitated crystals were collected by filtration, washed with water, and dried to obtain 0.32 g of 6-(4-N-allylaminophenyl)-1-(4-fluorophenyl)-4-oxo-1,4-dihydronicotinic acid having a melting point of 183-185°C.

*Example 20*

In 5 ml of benzene was dissolved 1 g of methyl 3-oxo-5-(pyrrol-2-yl)-4-pentenoate and to this solution was added 0.74 g of N,N-dimethylformamidodimethylacetal. They were reacted at 70°C for 1.5 hours. To the reaction mixture was then added 0.56 g of 4-hydroxyaniline, and they were further reacted at room temperature for 1 hour. The precipitated crystals were collected by filtration and dissolved in 10 ml of N,N-dimethylformamide. They were reacted at 140°C for 3 hours. After completion of the reaction, the reaction mixture was cooled to room temperature and the solvent was removed by distillation under reduced pressure. The residue was purified by a column chromatography (Wako Silica Gel C-200; eluent: chloroform) to obtain an oily substance. This oily substance was dissolved in 10 ml of dioxane, and to this solution was added dropwise a solution of 0.54 g of 2,3,5,6-tetrachloro-p-benzoquinone in 5 ml of dioxane at 95°C. Thereafter, the mixture was subjected to reaction at the same temperature for 30 minutes, and the reaction mixture was cooled to room temperature. The precipitated crystals were collected by filtration, dissolved in a mixture of 5 ml of methanol and 10 ml of a 10% by weight aqueous sodium hydroxide solution, and they were reacted at room temperature for 30 minutes. After completion of the reaction, the reaction mixture was adjusted to a pH of 6.0 with acetic acid, and the precipitated crystals were collected by filtration, washed with water, and dried to obtain 0.3 g of 1-(4-hydroxyphenyl)-4-oxo-6-(pyrrol-2-yl)-1,4-dihydronicotinic acid having a melting point of 250°C or more.

*Example 24*

(1) In 15 ml of N,N-dimethylformamide was dissolved 0.4 g of 6-(4-dimethylaminophenyl)-1-(4-hydroxyphenyl)-4-oxo-1,4-dihydronicotinic acid at room temperature, and to this solution was added 0.33 g of potassium carbonate. The resulting mixture was heated to 100°C for 1 hour. The reaction mixture thus obtained was cooled to room temperature, and 0.2 g of methoxymethyl chloride was added thereto. The resulting mixture was subjected to reaction at room temperature for 1 hour. After completion of this reaction, the solvent was removed by distillation under reduced pressure, and the residue was purified by a column chromatography (Wako Silica Gel C-200; eluent: chloroform/ethanol (30:1 by volume) mixture to obtain 0.16 g of methoxymethyl 6-(4-dimethylaminophenyl)-1-(4-methoxymethoxyphenyl)-4-oxo-1,4-dihydronicotinate having a melting point of 199 - 201°C and 0.13 g of methoxymethyl 6-(4-dimethylaminophenyl)-1-(4-hydroxyphenyl)-4-oxo-1,4-dihydronicotinate having a melting point of 211 - 213°C.

Methoxymethyl 6-(4-dimethylaminophenyl)-1-(4-methoxymethoxyphenyl)-4-oxo-1,4-dihydronicotinate:

IR (KBr)  $\text{cm}^{-1}$ :  $\nu_{\text{C=O}}$  1725, 1695.

Methoxymethyl 6-(4-dimethylaminophenyl)-1-(4-hydroxyphenyl)-4-oxo-1,4-dihydronicotinate:

IR (KBr)  $\text{cm}^{-1}$ :  $\nu_{\text{C=O}}$  1735, 1700.

(2) In 1 ml of ethanol was dissolved 0.08 g of methoxymethyl 6-(4-dimethylaminophenyl)-1-(4-methoxymethoxyphenyl)-4-oxo-1,4-dihydronicotinate at room temperature, and 1 ml of a 10% by weight aqueous sodium carbonate solution was added to the resulting solution. The resulting mixture was subjected to reaction at the same temperature for 1 hour. After completion of the reaction, the reaction mixture was adjusted to a pH of 6.0 with acetic acid, and the precipitated crystals were collected by filtration, washed with

5ml of water, and dried to obtain 0.06 g of 6-(4-dimethylaminophenyl)-1-(4-methoxymethoxyphenyl)-4-oxo-1,4-dihydronicotinic acid having a melting point of 150 - 152°C.

IR (KBr)  $\text{cm}^{-1}$ :  $\nu_{\text{C=O}}$  1720.

5 *Example 25*

In 12 ml of N,N-dimethylformamide was dissolved 0.6 g of methyl 1-(3-nitro-4-fluorophenyl)-6-(4-dimethylaminophenyl)-4-oxo-1,4-dihydronicotinate and to this solution was added 0.2 g of 5% by weight palladium carbon, and the above ester was hydrogenated under atmospheric pressure for 2 hours. Then, the catalyst was removed by filtration and the solvent was removed by distillation under reduced pressure. The resulting residue was dissolved in a mixture consisting of 2 ml of ethanol and 2 ml of a 1 N aqueous sodium hydroxide solution, and the solution was subjected to reaction at room temperature for one hour. This reaction mixture was mixed with 10 ml of water and 10 ml of chloroform, and the mixture was adjusted to a pH of 5.5 with acetic acid. The organic layer was separated, washed successively with 10 ml of water and 10 ml of a saturated aqueous solution of sodium chloride, and dried with anhydrous magnesium sulfate. Then the solvent was removed by distillation under reduced pressure, and the residue was purified by a column chromatography (Wako Silica Gel C-200; eluent: chloroform/ethanol (100:1 by volume) mixture) to obtain 0.1 g of 1-(3-amino-4-fluorophenyl)-6-(4-dimethylaminophenyl)-4-oxo-1,4-dihydronicotinic acid having a melting point of 198 - 201°C.

20 IR (KBr)  $\text{cm}^{-1}$ :  $\nu_{\text{C=O}}$  1720.

Example 26

To 0.2 g of 5% by weight palladium carbon was added 5 ml of methanol, and the resulting mixture was stirred under atmospheric pressure in a hydrogen atmosphere for 10 minutes. To this mixture was added a solution prepared by dissolving 0.3 g of methyl 6-[4-(p-nitrobenzyl)-2H-3,4-dihydrobenzo-1,4-oxazin-7-yl]-1-(4-fluorophenyl)-4-oxo-1,4-dihydronicotinate in 3 ml of methanol. The resulting mixture was subjected to hydrogenation at room temperature under 3 atm. for 2 hours. After completion of the reaction, the catalyst was removed by filtration and the solvent was removed by distillation under reduced pressure. The residue was purified by a column chromatography (Wako Silica Gel C-200; eluent: chloroform/ethanol (25:1 by volume) mixture) and the fraction containing the objective substance was concentrated to obtain 0.17 g of methyl 6-(2H-3,4-dihydrobenzo-1,4-oxazin-7-yl)-1-(4-fluorophenyl)-4-oxo-1,4-dihydronicotinate having a melting point of 194 - 197°C.

35 IR (KBr)  $\text{cm}^{-1}$ :  $\nu_{\text{C=O}}$  1725, 1695.

Example 27

In 10 ml of methanol was dissolved 0.5 g of 6-(4-hydroxy-3-nitrophenyl)-4-oxo-1-(4-fluorophenyl)-1,4-dihydronicotinic acid, and to this solution was added 0.1 g of 5% by weight palladium carbon. The said acid was hydrogenated under atmospheric pressure for 2 hours. After completion of the reaction, the reaction mixture was filtered and the filtrate was concentrated under reduced pressure to obtain 0.45 g of 6-(4-hydroxy-3-aminophenyl)-4-oxo-1-(4-fluorophenyl)-1,4-dihydronicotinic acid having a melting point of 231 - 233°C.

45 IR (KBr)  $\text{cm}^{-1}$ :  $\nu_{\text{C=O}}$  1730.

Example 28

In 7 ml of benzene was dissolved 0.6 g of methyl 5-(4-benzoyl-2H-3,4-dihydrobenzo-1,4-oxazin-6-yl)-3-oxo-4-pentenoate, and 0.2 g of N,N-dimethylformamidodimethylacetal was added to the solution. They were reacted at 60 - 70°C for 2 hours. The reaction mixture was cooled to room temperature, and 0.19 g of p-fluoroaniline was added thereto. The resulting mixture was subjected to reaction at room temperature for 4 hours. After completion of this reaction, the solvent was removed by distillation under reduced pressure, and the residue was purified by a column chromatography (Wako Silica Gel C-200; eluent: toluene/ethyl acetate (20:1 by volume) mixture). The fraction containing the objective substance was concentrated and the crystals thus formed were dissolved in 5 ml of N,N-dimethylformamide, and they were refluxed for 5 hours. After completion of the reaction, the solvent was removed by distillation under reduced pressure, and the residue was purified by a column chromatography (Wako Silica Gel C-200; eluent: chloroform). The fraction containing the objective substance was concentrated, and the oily substance thus formed was dissolved in 5 ml of dioxane, and 0.11 g of 2,3,5,6,-tetrachloro-p-benzoquinone was added to the resulting solution. The solution was subjected to reaction at 80 - 90°C for 30 minutes. After completion of the reaction, the solvent was removed by distillation under reduced pressure, and the residue was dissolved in 2 ml of chloroform. The insolubles were removed by filtration, and the filtrate was purified by a column chromatography (Wako Silica Gel C-200; eluent: chloroform). The fraction containing the objective substance was concentrated, and to crystals thus formed were added 5 ml of ethanol and 5 ml of a 1 N aqueous sodium hydroxide solution, and they were reacted at room temperature for 2 hours. After completion of this reaction, ethanol was

removed by distillation under reduced pressure, and the residue was adjusted to a pH of 6.5 with acetic acid. The precipitated crystals were collected by filtration, washed with water, and dried to obtain 0.4 g of 6-(2H-3,4-dihydrobenzo-1,4-oxazin-6-yl)-1-(4-fluorophenyl)-4-oxo-1,4-dihydronicotinic acid having a melting point of 155 - 167°C.

25

In 5 ml of benzene was dissolved 0.3 g of methyl 5-phenyl-3-oxo-4-pentenate, and 0.2 g of N,N-dimethylformamidodimethylacetal was added to the solution. They were reacted at 60 - 70°C for 2 hours. The reaction mixture was cooled to room temperature, and 0.3 g of 4-(4-acetylpirperazino)-aniline was added thereto. The mixture was subjected to reaction at room temperature for 4 hours. After completion of the reaction, the solvent was removed by distillation under reduced pressure, and the oily substance thus obtained was dissolved in 5 ml of N,N-dimethylformamide, and they were refluxed for 5 hours. After completion of the reaction, the solvent was removed by distillation under reduced pressure, and the residue was purified by a column chromatography (Wako Silica Gel C-200; eluent: chloroform/ethanol (25:1 by volume) mixture). The fraction containing the objective substance was concentrated, and the oily substance thus obtained was dissolved in 4 ml of dioxane, and 0.12 g of 2,3,5,6-tetrachloro-p-benzoquinone was added thereto. They were reacted at 90 - 100°C for 30 minutes. After completion of the reaction, the solvent was removed by distillation under reduced pressure, and the residue was purified by a column chromatography (Wako Silica Gel C-200; eluent: chloroform/ethanol (100:3 by volume) mixture). The fraction containing the objective substance was concentrated, and to the crystals thus formed were added 3 ml of 6 N hydrochloric acid, and the resulting mixture was refluxed for 2 hours. Water was removed by distillation under reduced pressure, to obtain 0.12 g of 6-phenyl-1-(4-piperazinophenyl)-4-oxo-1,4-dihydronicotinic acid dihydrochloride having a melting point of 211 - 213°C (decomp.)

(2) In 5 ml of N,N-dimethylformamide was dissolved 0.7 g of methyl 5-(cyclopenten-1-yl)-2-(4-hydroxy-2-methylphenylaminomethylene)-3-oxo-4-pentenoate, and they were reacted at 140°C for 2 hours. After completion of the reaction, the solvent was removed by distillation under reduced pressure, and the residue was purified by a column chromatography (Wako Silica Gel C-200; eluent: chloroform) to obtain an oily substance. This oily substance was dissolved in 10 ml of dioxane, and 0.5 g of 2,3,5,6-tetrachloro-p-benzoquinone was added thereto. They were reacted at 80°C for 30 minutes. The reaction mixture was cooled to room temperature, and the precipitated crystals were collected by filtration, and washed with 5 ml of dioxane. These crystals were dissolved in a mixture of 5 ml of methanol and 5 ml of a 1 N aqueous sodium hydroxide solution, the resulting mixture was subjected to reaction at room temperature for 30 minutes. The reaction mixture was adjusted to a pH of 5.5 with acetic acid and the precipitated crystals were collected by filtration, washed with water, and dried to obtain 0.3 g of 6-(cyclopenten-1-yl)-1-(4-hydroxy-2-methylphenyl)-4-oxo-1,4-dihydronicotinic acid having a melting point of 211 - 213°C.

IR (KBr) cm<sup>-1</sup>: ν<sub>C=O</sub> 1720, 1700.

The compounds shown in Table 33 were obtained in the same manner.

*Example 37*

In 5 ml of benzene was dissolved 0.3 g of methyl 5-cyclooctyl-3-oxo-4-pentenoate, and 0.3 g of N,N-dimethylformamidodimethylacetal was added thereto. They were reacted at 70°C for one hour. Then, the reaction mixture was cooled to room temperature, and 0.27 g of 4-hydroxy-2-methylaniline was added thereto. The resulting mixture was subjected to reaction at room temperature for 2 hours. After completion of this reaction, the solvent was removed by distillation under reduced pressure, and the residue was purified by a column chromatography (Wako Silica Gel C-200; eluent: toluene/ethyl acetate (50:1 by volume) mixture). The fraction containing the objective substance was concentrated, and the oily substance thus obtained was dissolved in 5 ml of N,N-dimethylformamide and the resulting mixture was refluxed for 4 hours. After completion of the reaction, the solvent was removed by distillation under reduced pressure, and the residue was purified by a column chromatography (Wako Silica Gel C-200; eluent: chloroform/ethanol (50:1 by volume) mixture). The fraction containing the objective substance was concentrated and the oily substance thus obtained was dissolved in 5 ml of dioxane, and 0.2 g of 2,3,5,6-tetrachloro-p-benzoquinone was added thereto, and they were reacted at 80 - 90°C for 30 minutes. The reaction mixture was cooled to room temperature, and the precipitated crystals were collected by filtration. These crystals were dissolved in 20 ml of chloroform, and after removing the insolubles, the chloroform was removed by distillation under reduced pressure. To the residue were added 5 ml of a 1 N aqueous sodium hydroxide solution and 5 ml of methanol, and they were reacted at room temperature for 30 minutes. After the methanol was removed by distillation under reduced pressure, the resulting solution was adjusted to a pH of 6.5 with 2 N hydrochloric acid, and the precipitated crystals were collected by filtration, washed with water, and dried to obtain 0.14 g of 6-cyclooctyl-1-(4-hydroxy-2-methylphenyl)-4-oxo-1,4-dihydroneicotinic acid having a melting point of 118 - 120°C.

IR (KBr) cm<sup>-1</sup>: ν<sub>C=O</sub> 1725, 1710.

*Example 40*

(1) In 315 ml of dioxane was dissolved 10.5 g of methyl 1-(4-acetoxy-2-methylphenyl)-6-methyl-4-oxo-1,4-dihydronicotinate under heating, and 4.43 g of selenium dioxide was added thereto. They were reacted at 100°C for 2 hours. After cooling the reaction mixture, to room temperature, selenium was removed by 5 filtration, and then the solvent was removed by distillation under reduced pressure. The residue was purified by a column chromatography (Wako Silica Gel C-200; eluent: chloroform/ethanol (25:1 by volume) mixture) to obtain 7.9 g of methyl 1-(4-acetoxy-2-methylphenyl)-6-formyl-4-oxo-1,4-dihydronicotinate having a melting point of 216 - 217°C.

10 IR (KBr)  $\text{cm}^{-1}$ :  $\nu_{\text{C=O}}$  1760, 1730, 1700 (sh) 10

(2) To 0.95 g of methyl 1-(4-acetoxy-2-methylphenyl)-6-formyl-4-oxo-1,4-dihydronicotinate was added 5 ml of 6 N hydrochloric acid, and they were reacted at 100°C for one hour. The reaction mixture was cooled to room temperature, and adjusted to a pH of 7.5 with a saturated aqueous sodium hydrogencarbonate 15 solution. Then, 100 ml of acetonitrile was added, and the aqueous layer was saturated with sodium chloride. The organic layer was separated, washed with a saturated aqueous solution of sodium chloride and then dried with anhydrous magnesium sulfate. The solvent was removed by distillation under reduced pressure to obtain 0.6 g of 6-formyl-1-(4-hydroxy-2-methylphenyl)-4-oxo-1,4-dihydronicotinic acid having a melting point of 230 - 250°C. 20

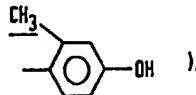

20 IR (KBr)  $\text{cm}^{-1}$ :  $\nu_{\text{C=O}}$  1715. 20

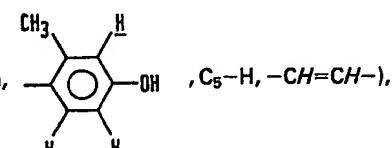

(3) In 5 ml of methanol was dissolved 0.15 g of 6-formyl-1-(4-hydroxy-2-methylphenyl)-4-oxo-1,4-dihydronicotinic acid, and 0.19 g of ethoxycarbonylmethylenetriphenylphospholane was added thereto. 25 They were reacted at room temperature for one hour. After completion of the reaction, the solvent was removed by distillation under reduced pressure, and the residue was purified by a column chromatography (Wako Silica Gel C-200; eluent: chloroform/ethanol (50:1 by volume) mixture) to obtain 0.06 g of 6-(2-ethoxycarbonylethethyl)-1-(4-hydroxy-2-methylphenyl)-4-oxo-1,4-dihydronicotinic acid having a melting point of 185 - 189°C. 30

30 IR (KBr)  $\text{cm}^{-1}$ :  $\nu_{\text{C=O}}$  1720, 1705. 30

(4) To 0.09 g of 6-(2-ethoxycarbonylethethyl)-1-(4-hydroxy-2-methylphenyl)-4-oxo-1,4-dihydronicotinic acid was added 3 ml of 6 N hydrochloric acid, and they were reacted at 100°C for 1.5 hours. After completion of 35 the reaction, the solvent was removed by distillation under reduced pressure, and to the crystals thus formed were added 3 ml of diethyl ether, and the resulting mixture was filtered to obtain 0.08 g of 6-(2-carboxyethenyl)-1-(4-hydroxy-2-methylphenyl)-4-oxo-1,4-dihydronicotinic acid having a melting point of 280°C or more. 40

*Example 42*

In 20 ml of N,N-dimethylformamide was dissolved 2 g of methyl 1-(4-benzyloxy-2-methylphenyl)-6-(2-chloroethyl)-4-oxo-1,4-dihydronicotinate, and 0.9 g of 4-ethyl-2,3-dioxopiperazine-1-sodium was added thereto at 5°C over 20 minutes, and they were reacted at the same temperature for 30 minutes. After completion of the reaction, the solvent was removed by distillation under reduced pressure, and the residue was dissolved in 20 ml of chloroform, washed successively with 20 ml of water and 20 ml of a saturated aqueous solution of sodium chloride and then dried with anhydrous magnesium sulfate. The solvent was removed by distillation under reduced pressure to obtain an oily substance, and this oily substance was dissolved in a mixture of 10 ml of methanol and 10 ml of a 1 N aqueous sodium hydroxide solution. They were reacted at room temperature for 30 minutes. After completion of the reaction, the reaction mixture was adjusted to a pH of 6.0 with acetic acid, and the precipitated crystals were collected by filtration, washed with water, and then dissolved in 10 ml of dioxane and 5 ml of water. Further, 0.2 g of 5% by weight palladium carbon was added thereto, and the resulting mixture was subjected to hydrogenation for 10 hours. After completion of this reaction, the reaction mixture was filtered, and the filtrate was concentrated under

reduced pressure to obtain 0.8 g of 6-[2-(4-ethyl-2,3-dioxopiperazin-1-yl)-ethyl]-1-(4-hydroxy-2-methylphenyl)-4-oxo-1,4-dihydronicotinic acid having a melting point of 182 - 190°C (decomp.).

IR (KBr)  $\text{cm}^{-1}$ :  $\nu_{\text{C=O}}$  1730.

5 **Example 43**

In 20 ml of benzene was dissolved 3.0 g of methyl 7-(4-benzyloxycarbonyl-piperazin-1-yl)-3-oxo-4-heptenoate, and 1.2 g of N,N-dimethylformamidodimethylacetal was added thereto. They were reacted at 70°C for 1.5 hours. The reaction mixture was cooled to room temperature, and 1.0 g of 4-hydroxy-2-methylaniline was added thereto. The resulting mixture was subjected to reaction at the same temperature for 1.5 hours. After completion of this reaction, the precipitated crystals were collected by filtration, and washed with 10 ml of benzene. The crystals thus formed were dissolved in 20 ml of N,N-dimethylformamide, and they were reacted at 140°C for 3 hours. After completion of the reaction, the reaction mixture was cooled to room temperature, and the solvent was removed by distillation under reduced pressure. The residue was purified by a column chromatography (Wako Silica Gel C-200; eluent: chloroform) to obtain an oily substance. This oily substance was dissolved in 20 ml of dioxane, and 0.7 g of 2,3,5,6-tetrachloro-p-benzoquinone was added thereto, and they were reacted at 80°C for 30 minutes. After completion of the reaction, the reaction mixture was cooled to room temperature, and the precipitated crystals were collected by filtration, and washed with 10 ml of dioxane. The resulting crystals were dissolved in 10 ml of a 1 N aqueous sodium hydroxide solution, and the resulting solution was subjected to reaction at room temperature for 30 minutes. The reaction mixture was adjusted to a pH of 6.0 with acetic acid, and the precipitated crystals were collected by filtration, washed with water, and then dissolved in 10 ml of dioxane and 5 ml of water. Further, 0.2 g of 5% by weight palladium carbon was added thereto. The resulting mixture was subjected to hydrogenation under atmospheric pressure for 2 hours. After completion of the reaction, to 25 the reaction mixture was added 5 ml of 2 N hydrochloric acid, and the resulting mixture was filtered, after which the filtrate was concentrated to obtain 0.4 g of 1-(4-hydroxy-2-methylphenyl)-6-[2-(piperazine-1-yl)-ethyl]-4-oxo-1,4-dihydronicotinic acid dihydrochloride having a melting point of 140 - 148°C.

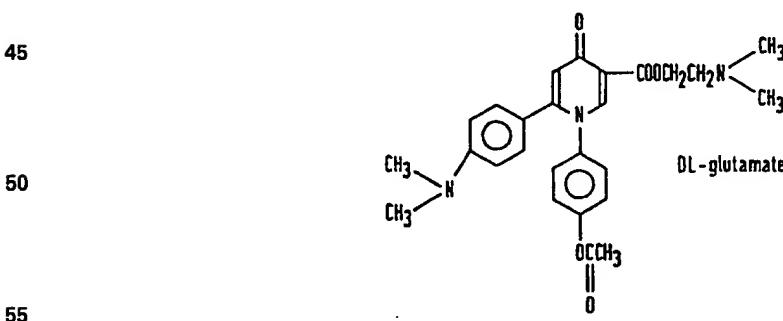

IR (KBr)  $\text{cm}^{-1}$ :  $\nu_{\text{C=O}}$  1720

30 **Example 44**

In 5 ml of water was suspended 0.15 g of dimethylaminoethyl 1-(4-acetoxyphenyl)-6-(4-dimethylaminophenyl)-4-oxo-1,4-dihydronicotinate at room temperature, and 0.04 g of L-aspartic acid was added thereto. They were reacted at 60°C for 30 minutes, and the reaction mixture was cooled to room temperature. The insolubles were removed by filtration, and the solvent was removed by distillation under reduced pressure. The residue was dehydrated azeotropically with toluene and dried to obtain 1.2 g of L-aspartate salt of dimethylaminoethyl 1-(4-acetoxyphenyl)-6-(4-dimethylaminophenyl)-4-oxo-1,4-dihydronicotinate having a melting point of 144 - 147°C.

40 IR (KBr)  $\text{cm}^{-1}$ :  $\nu_{\text{C=O}}$  1760, 1725, 1700

The following compound was obtained in the same manner:

Melting point (°C): 115 - 118.

IR (KBr)  $\text{cm}^{-1}$ :  $\nu_{\text{C=O}}$  1760, 1725, 1700.

60 **Example 45**

In 20 ml of methylene chloride was dissolved 0.8 g of 1-(4-acetoxyphenyl)-6-(4-dimethylaminophenyl)-4-oxo-1,4-dihydronicotinic acid, and the resulting solution was cooled to 5°C. To this solution was added dropwise 0.3 g of oxalyl chloride at the same temperature, and they were reacted for one hour. After completion of the reaction, 0.84 g of 1,2-O-isopropylidene glycerin and 0.26 g of triethylamine were added successively at the same temperature, and the resulting mixture was further subjected to reaction for 2

hours. This reaction mixture was introduced into 50 ml of ice water, and the organic layer was separated, washed successively with 50 ml of water and then with 50 ml of a saturated aqueous solution of sodium chloride, and dried with anhydrous magnesium sulfate. The solvent was removed by distillation under reduced pressure, and the residue was suspended in 15 ml of 60% by weight acetic acid. The suspension was subjected to reaction at 60°C for 3 hours. After completion of this reaction, the solvent was removed by distillation under reduced pressure, and the residue was purified by a column chromatography (Wako Silica Gel C-200; eluent: chloroform/ethanol (15:1 by volume) mixture) to obtain 0.3 g of 2,3-dihydroxypropyl 1-(4-acetoxyphenyl)-6-(dimethylaminophenyl)-4-oxo-1,4-dihydronicotinate having a melting point of 145-147°C.

10 IR (KBr)  $\text{cm}^{-1}$ :  $\nu_{\text{C=O}}$  1760, 1730, 1680.

10

*Preparation Example 1*

With 50 g of 1-pivaloyloxyethyl 6-(4-dimethylaminophenyl)-1-(4-fluorophenyl)-4-oxo-1,4-dihydronicotinate were mixed 49 g of crystalline cellulose, 50 g of corn starch and 1 g of magnesium stearate, and the resulting mixture was tableted into 1,000 flat tablets.

15

*Preparation Example 2*

With 100 g of 1-pivaloyloxyethyl 6-(4-dimethylaminophenyl)-1-(4-fluorophenyl)-4-oxo-1,4-dihydronicotinate was mixed 50 g of corn starch, and the resulting mixture was encapsulated to form 1,000 capsules.

20

*Preparation Example 3*

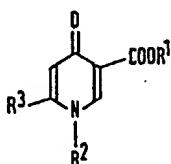

In a suitable amount of distilled water for injection were dissolved 200 mg of sodium 1-(2-fluoro-4-hydroxyphenyl)-6-(1-methylindol-5-yl)-4-oxo-1,4-dihydronicotinate and 250 mg of dextrose, and this solution was placed in a 5-ml ampule. After purging with nitrogen, the ampul was sterilized under pressure at 121°C for 15 minutes to obtain an injection.

25

**CLAIMS**

30 1. A 4-oxo-1,4-dihydronicotinic acid derivative or its salt, said derivative being represented by the formula:

30

40 wherein R¹ represents a hydrogen atom or a carboxyl-protecting group, R² represents a substituted aryl group or a substituted or unsubstituted heterocyclic group; and R³ represents a haloalkyl group, an aminoalkyl group or a substituted or unsubstituted alkenyl, aralkenyl, aralkyl, aralkadienyl, aralkynyl, heterocyclic alkyl, heterocyclic alkenyl, aryl, cycloalkyl, cycloalkenyl, acyl, iminoalkyl, heterocyclic or bridged hydrocarbon group.

40

45 2. A 4-oxo-1,4-dihydronicotinic acid derivative or its salt according to Claim 1, wherein R³ represents a substituted or unsubstituted aralkenyl, aralkadienyl, aralkynyl, aryl, heterocyclic alkenyl or heterocyclic group.

45

50 3. A 4-oxo-1,4-dihydronicotinic acid derivative or its salt according to Claim 1, wherein R³ is a haloalkyl group, an aminoalkyl group, or a substituted or unsubstituted alkenyl, cycloalkyl, cycloalkenyl, aralkyl, heterocyclic alkyl, iminoalkyl, acyl or bridged hydrocarbon group, provided that the case where the alkenyl group is substituted by an aryl or heterocyclic group is excluded.

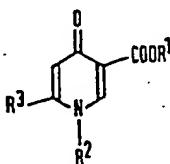

50

4. A 4-oxo-1,4-dihydronicotinic acid derivative or its salt according to Claim 1, 2 or 3, wherein R² represents a substituted aryl group.

55

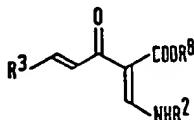

55 5. A 4-oxo-1,4-dihydronicotinic acid derivative or its salt according to Claim 4, wherein the substituted aryl group is a phenyl or naphthyl group substituted by at least one substituent selected from the group consisting of a halogen atom and hydroxyl and alkyl groups.

6. A process for producing a 4-oxo-1,4-dihydronicotinic acid derivative or its salt, said derivative being represented by the formula:

wherein R<sup>1</sup> represents a hydrogen atom or a carboxyl-protecting group; R<sup>2</sup> represents a substituted aryl group or a substituted or unsubstituted heterocyclic group; and R<sup>3</sup> represents a haloalkyl group, an aminoalkyl group or a substituted or unsubstituted alkenyl, aralkenyl, aralkyl, aralkadienyl, aralkynyl, heterocyclic alkyl, heterocyclic alkenyl, aryl, cycloalkyl, cycloalkenyl, acyl iminoalkyl, heterocyclic or bridged hydrocarbon group, which comprises subjecting to ring-closure reaction a compound represented by the formula:

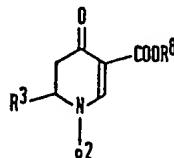

10

10

wherein R<sup>2</sup> and R<sup>3</sup> have the same meanings as defined above, and R<sup>8</sup> represents the same carboxyl-protecting group as R<sup>1</sup>, to obtain a 4-oxo-1,4,5,6-tetrahydronicotinic acid derivative represented by the formula:

20

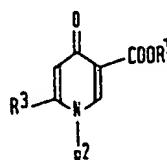

20

25

wherein R<sup>2</sup>, R<sup>3</sup> and R<sup>8</sup> have the same meanings as defined above, and then subjecting the thus obtained derivative to dehydrogenation reaction, and if desired, to removal of the carboxyl-protecting group.

7. A process for producing a 4-oxo-1,4-dihydronicotinic acid derivative or its salt, said derivative being represented by the formula:

30

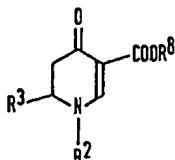

30

35

wherein R<sup>1</sup> represents a hydrogen atom or a carboxyl-protecting group; R<sup>2</sup> represents a substituted aryl group or a substituted or unsubstituted heterocyclic group; and R<sup>3</sup> represents a haloalkyl group, an aminoalkyl group or a substituted or unsubstituted alkenyl, aralkenyl, aralkyl, aralkadienyl, aralkynyl, heterocyclic alkyl, heterocyclic alkenyl, aryl, cycloalkyl, cycloalkenyl, acyl iminoalkyl, heterocyclic or bridged hydrocarbon group, which comprises subjecting to dehydrogenation a 4-oxo-1,4,5,6-tetrahydronicotinic acid derivative represented by the formula:

45

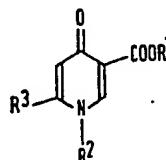

45

50

wherein R<sup>2</sup> and R<sup>3</sup> have the same meanings as defined above and R<sup>8</sup> represents the same carboxyl-protecting group as R<sup>1</sup>, and if desired, to removal of carboxyl-protecting group.

8. An antibacterial agent comprising a 4-oxo-1,4-dihydronicotinic acid derivative or its salt, said derivative being represented by the formula:

50

55

wherein R<sup>1</sup> represents a hydrogen atom or a carboxyl-protecting group; R<sup>2</sup> represents a substituted aryl group or a substituted or unsubstituted heterocyclic group; and R<sup>3</sup> represents a haloalkyl group, an aminoalkyl group or a substituted or unsubstituted alkenyl, aralkenyl, aralkyl, aralkadienyl, aralkynyl, heterocyclic alkyl, heterocyclic alkenyl, aryl, cycloalkyl, cycloalkenyl, acyl, iminoalkyl, heterocyclic or bridged hydrocarbon group.

5 9. A derivative as claimed in claim 1 and substantially as described in any one of the specific examples hereinbefore set forth.

10 10. A process as claimed in claim 9 and substantially as described in any one of the specific examples hereinbefore set forth.

10 11. Each and every novel embodiment herein set forth when considered either separately or in combination.
